. Error using feval Dimensions of arrays being concatenated are not consistent. Error in feval (line 7) fprintf('%s ',name1); A: You have to use the function version of fwrite. Use: fwrite(fp,char(name1),'char'); You could write the whole code like this: if ~exist('lic', 'file') %// This will load the license file for you. load('lic'); %// You can load it using different methods, like read(filename) %// see end fp = fopen('students.txt','w'); for i = 1:length(name1) fprintf(fp,'%s ',name1{i}); fclose(fp); This will save your student IDs in the file students.txt. This is one way of doing it. Hope it helps. EDIT: I changed it so that you use the license file to load the names. The effects of the herpes simplex virus type 1 glycoprotein I (gI) gene and herpes simplex virus type 1 (HSV-1) infection on expression of matrix metalloproteinase-9 and its potential significance in viral pathogenesis. Matrix metalloproteinases (MMPs) are important enzymes for the destruction of extracellular matrix and tissue remodeling. Herpes simplex virus type 1 (HSV-1) infection is usually associated with a range of disease states including those associated with corneal stromal degradation and ulceration. The gI gene of HSV-1 is known to play a role in the virulence of the virus. In the present study, the effects of gI and HSV-1 infection on the expression of MMP-9 was evaluated in human corneal fibroblasts

(HCFs) and human conjunctival fibroblasts (HCFs). Transient transfection of gI inhibited MMP-9 promoter activity and mRNA expression in both HCFs cell lines. We show that the suppression of MMP-9 transcriptional activity induced by 82157476af
